eosinophils according to the staining characteristics of their cytoplasmic granules. Granule proteins are released by physiologic and pharmacologic stimuli and play important roles in both normal and pathological host immune responses. Eosinophil major basic protein and eosinophil peroxidase (EPX) are granule proteins specific to the eosinophil. AHE-1 recognizes human EPX, a granule protein specific to eosinophils. It does not cross-react with eosinophil major basic protein, elastase, cathepsin G, esterase N, thrombin, plasmin, kallikrein, lactoferrin, or transferrin. This monoclonal antibody stains eosinophils only and does not stain other peripheral blood cells, including platelets, neutrophils, monocytes, lymphocytes or red blood cells. Human EPX gene product can form a tetramer of two light chains and two heavy chains. Other peroxidase family members include myeloperoxidase (MPO), lactoperoxidase	eos gra stir res gra gra ma kal onl neu pro	sinophils according to the staining characteristics of their cytoplasmic anules. Granule proteins are released by physiologic and pharmacologic muli and play important roles in both normal and pathological host immune sponses. Eosinophil major basic protein and eosinophil peroxidase (EPX) are anule proteins specific to the eosinophil. AHE-1 recognizes human EPX, a anule protein specific to eosinophils. It does not cross-react with eosinophil ajor basic protein, elastase, cathepsin G, esterase N, thrombin, plasmin, likrein, lactoferrin, or transferrin. This monoclonal antibody stains eosinophils by and does not stain other peripheral blood cells, including platelets, utrophils, monocytes, lymphocytes or red blood cells. Human EPX gene oduct can form a tetramer of two light chains and two heavy chains. Other
(LPO), and thyroid peroxidase (TPO).
