| Marker                  | Squamous, Basal & Myoepithelial Cell Marker                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Specificity/Sensitivity | p63 consists of two major isoforms-TAp63 and delta-Np63. These isoforms differ<br>in the structure of the N-terminal domains. The TAp63 isoform (identified by anti-<br>p63 antibody) contains a transactivation-competent TA domain with homology to<br>p53, which regulates the expression of the growth-inhibitory genes. In contrast,<br>DNp63 isoform (identified by anti-p40 antibody) contains an alternative<br>transcriptionally-inactive delta-N domain, which antagonizes the activity of TAp63<br>and p53. P40/3980R recognizes exclusively delta-Np63 but not TAp63. p40 is a<br>squamous cell carcinoma specific antibody. It reacts with the vast majority of<br>cases of squamous cell carcinomas of various origins, but not with<br>adenocarcinomas. It is particularly useful in differentiating lung squamous cell<br>carcinoma from lung poorly differentiated adenocarcinoma. p40 antibody can<br>also be used as an alternative basal cell/myoepithelial cell marker, which has<br>similar sensitivity and specificity as that of p63 antibody. Therefore, p40 antibody<br>may also be used as an alternative immunohistochemical marker for determining<br>prostate adenocarcinoma vs. benign prostate glands and for determining breast<br>intraductal carcinoma vs. invasive breast ductal carcinoma. |
| Immunogen               | A synthetic peptide from the N-terminal of human p63/TP73Lprotein (Exact sequence is proprietary) (Uniprot: Q9H3D4)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
